

## MATHEMATICS 338

## COMBINATORICS

## I. Introduction

## A. Catalog Description

The study of the basic principles of combinatorial analysis. Topics include combinations, permutations, inclusion-exclusion, recurrence relations, generating functions, and graph theory. Additional material is chosen from among the following topics: Latin squares, Hadamard matrices, designs, coding theory, and combinatorial optimization. Satisfies the proof-based requirement in major contracts. *Prerequisite: MATH 290.* Offered every three years; next offered Spring 2008.

## B. Objectives

This course is designed to introduce the student to the basic principles and techniques of combinatorics. After completing the basic material, the instructor can choose from among several topics to use as vehicles for displaying in-depth applications of the basic concepts. In addition to mathematics majors, this course should be useful for computer science majors, and those interested in elementary or secondary education.

## C. Prerequisites

The prerequisite is Math 290.

## II. Required Topics

A. Basic counting, product and sum rules

B. Combinations and permutations, with repeated or distinct elements

C. Inclusion-Exclusion

D. Recurrence relations, Generating functions

E. Graph Theory

1. Euler circuits

2. Hamiltonian paths

3. Connectivity

4. Trees

5. Planar Graphs

6. Coloring

## III. Additional Topics

- A. Latin Squares
- B. Hadamard Matrices
- C. Designs
- D. Coding Theory
- E. Sphere Packing
- F. Systems of Distinct Representatives
- G. Combinatorial Optimization
- H. Network Flows

## IV. Bibliography

The books listed below have been chosen as possible textbooks for the course. Each has a different point of view, emphasizes different topics and they are written at differing levels of difficulty, but most of them cover all the topics listed above as core topics.

- |                             |   |
|-----------------------------|---|
| Berman, G., Fryer, K.D.,    | <u>Introduction to Combinatorics</u>              |
| Bogart, Kenneth P.,         | <u>Introductory Combinatorics</u>                 |
| Brualdi, Richard A.,        | <u>Introductory Combinatorics</u>                 |
| Bryant, Victor,             | <u>Aspects of Combinatorics</u>                   |
| Merris, Russ                | <i>Combinatorics</i>                              |
| Straight, M. Joseph,        | <u>Combinatorics, An Invitation</u>               |
| Even, Shimon,               | <u>Algorithmic Combinatorics</u>                  |
| Jackson, B.W., Thoro, D.,   | <u>Applied Combinatorics with Problem Solving</u> |
| Liu, C.L.,                  | <u>Introduction to Combinatorial Mathematics</u>  |
| Street, A.P., Wallis, W.D., | <u>Combinatorics: A First Course</u>              |
| Tucker, Alan,               | <u>Applied Combinatorics</u>                      |

The texts below have been chosen as books that a student or instructor of this course might be interested in consulting. Some, like Wilson, are excellent textbooks but might only be useful for a portion of the course. Others, like Aigner, are reference texts for researchers and would be beyond the ability of an undergraduate to comprehend. Others are inbetween these two extremes. Vilenkin is noteworthy in that it contains over 400 word problems with solutions.
